Related Categories: ValidateThis

Just a quick note to announce the release of version 1.2 of **ValidateThis**, an awesome validation framework for ColdFusion. This version includes a new feature: **processOn** (described below), as well as some small fixes contributed by **John Whish** and **Dustin Martin**.

## processOn

This is a feature that was requested by some users which allows you to define a rule which can be processed on either only the server side or only the client side. You do so by adding the *processOn* attribute to your *rule* entity and giving it a value of either *server* or *client*. The default value is *both*, so if you leave this attribute off (as all legacy definitions will) it has no effect and your validations are enforced on both the client and the server.

For those of you still not intimately familiar with the framework, here are some resources to help you out:

- The main home of the framework is [www.validatethis.org](http://www.validatethis.org), which includes an online demo and links to all of the following.
- The framework can be downloaded from the [ValidateThis RIAForge page](#).
- Online documentation is available at [www.validatethis.org/docs](http://www.validatethis.org/docs).
- API documentation is available at [www.validatethis.org/docs/api](http://www.validatethis.org/docs/api).
- There is a Google group available for asking questions, making suggestions, and general discussion at [groups.google.com/group/validatethis](http://groups.google.com/group/validatethis).
- The source code is hosted at [GitHub](#), and contributions are always welcome.
